Function,section

General:

The 2 type M-.SEW directional valve is a solenoid actuated directional poppet valve.They control the start, stop and direction of a flow.They basically consist of a housing (1),the solenoids (2), the hardened valve system (3) and the ball(s) (4) as the closing element.

Basic principle:

In the initial position the ball (4) is pressed onto the seat by the spring (9), and in the switched position by the solenoid (2). The solenoid (2) force acts via the lever (6) and the ball (7) on the actuator pin (8), which is sealed on two sides.The chamber between the two sealing elements is connected with port P. The valve system (3) is thereby pressure balanced with regard to the actuating forces (sole-noid or return spring). The valves can, therefore, be used up to a pressure of 63 MPa.

Note:

The 3/2-way poppet valves have a "negative switching overlap". Therefore, port T must always be connected.This means that during the switching process - from the start of opening one valve seat to the closing of the other seat - all of the ports P-A-T are connected with each other. This, however, takes place in such a short space of time that in most applications it is irrelevant.

The hand override (10) makes it possible to switch the valve without energizing the solenoids.

Care has to be taken to ensure that the stated maximum flows are not exceeded! If necessary a cartridge throttle for flow limitation has to be fitted (see below).

The following possibilities are obtainable via the seat orientation:

Illustration: 4/2-way poppet valve

In conjunction with a sandwich plate, a plus-1 plate, under the 3/2-way poppet valve this valve can be used as 4/2-way poppet valve.

Function of the plus-1 plate:

Initial position:
The main valve is not actuated.The spring (9) holds the ball (4.1) on the seat (11). Port P is closed and A is connected to T. In addition, a control line runs from A to the large area of the control spool (12), which is thus unloaded to tank.The pressure applied via P now moves the ball (13) onto seat (14).Thus, P is connected to B and A with T.

Transition position:
When the main valve is operated, the ball (4.2) is pushed against the spring (9) and then pressed onto the seat (15).Port T is then blocked,P,A and B are connected to each other for a short time.

Switched postion:
P is connected to A. As the pump pressure acts via A on the large area of the control spool (12), the ball (13) is pushed onto seat (16). Thus, B is connected to T and P to A. Ball (13) in the plus-1 plate has a "positive switching overlap".
In order to avoid pressure intensification when single rod cylindes are used, the annulus area of the cylinder must be connected to A.

Due to the use of the plus-1 plate and the arrangement of the seats, the following combinations are possible:

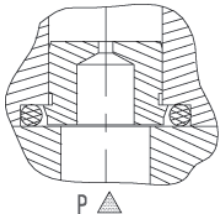
Cartridge throttle

The use of the cartridge throttle is necessary when, due to operational conditions during the switching process, flows can occur that exceed the valve performance limits.
Example:
- Accumulator operation,
- Use as a pilot valve with internal pilot oil supply.

3/2-way poppet valve
The cartridge throttle is fitted into port P of the poppet valve.

4/2-way poppet valve
The cartridge throttle is fitted into port P of the plus-1 plate.



Cartridge check valve

The carteige check valve allows free flow from P to A and provides leak-free closure from A to P.
For examples.

3/2-way poppet valve
The cartridge check valve is inserted into port P of the poppet valve.

4/2-way poppet valve
The cartridge check valve is inserted intoport P of the plus-1 plate.

1) Plug-in connectors have to be ordered separately (see below).

2) For the connection to an AC supply a DC solenoid must be used which is controlled via a rectifier (see table on the left).
For individual connections a large plug-in connector with integrated rectifier can be used (separate order, see below).

General guidelines

In order to operate the valve safely and to hold it safely in the switched position, the pressure in P must be ⩾A ⩾ T (for design reasons).

The ports P, A and T (3/2-way poppet valve) as well as P, A, B and T (4/2-way poppet valve) are positively assigned to their individual functions. They must not be interchanged or plugged.Flow is only permitted in the direction of the arrow.

When using the plus-1 plate (4/2-way function) the following lower operating values must be taken into account:p min = 0.8 MPa; q_V > 3 L/min.

The specified maximum flow must not be exceeded.

The performance limit was determined with the solenoids at operating temperature, 10% under voltage and with the tank not pressurized.
