

## Catálogo de Productos

**Fixed Displacement Vane Pumps - PVV / PVQ**

# Fixed displacement vane pumps

## Types PVV and PVQ

Nominal sizes 18 to 193

Series 1X

Maximum operating pressure 210 bar

Maximum displacement 18 to 193 cm<sup>3</sup>

### Features

---

- Fixed displacement
  - Long bearing life due to hydraulically unloaded shaft
  - Low wear due hydraulically unloaded vanes
  - Low operating noise
  - Easy to service due to exchangeable pump cartridges
  - Good efficiency
  - Optional positioning of the pressure connection
  - Clockwise or anti-clockwise direction of rotation
  - Drive shaft optionally; cylindrical or splined
- Double pump:
- Very compact design
  - The position of the pressure connections can be individually selected

## Function, section

The PVV and PVQ hydraulic pumps are fixed displacement vane pumps.

The rotor (2) is fitted onto the splines of the drive shaft (1) which rotates inside the stator ring (3). The vanes (4) are fitted into slots in the rotor and are pressed onto the inner surface of the stator ring by centrifugal force as the rotor turns. The displacement chambers are sealed on the sides by the control plates (5). Due to the double eccentric form of the stator ring there are two pressure and two suction chambers opposite to each other. The drive shaft is thereby hydraulically unloaded. It

only has to carry the torque forces. The vanes are partially unloaded as they pass through the suction areas. This unloading results in reduction in wear and makes it possible to obtain a high efficiency.

By simply removing the cover (6) it is possible to remove the pump cartridge (comprising of rotor, vanes, stator ring and control plates) without having to remove the housing (7) from the pump mounting bracket. This makes it possible to quickly repair and maintain the pump.

The design of the type PVQ pump makes it particularly suitable for mobile applications.

The special design of the control plates makes it possible to compensate for the heat expansion of the rotor and to act against sudden pressure changes. Due to the division of the control plates (7) into flexible discs and the cover plates (8),

counter pressure chambers (9) are created that are balanced against the pressures that are in the displacement chambers. Due to this, the optimum clearance between the rotor and the flexible discs is guaranteed and thus the best volumetric efficiency is made possible.

## Function, section

The PVV and PVQ double pumps are created by fitting a second pump cartridge onto a mutual shaft. The oil inlet is via a common suction connection in the centre housing (10). The oil outputs is separate via the pump cartridge. The pressure connection for the front pump cartridge is in the flange housing and for the rear pump cartridge in the cover plate.

The largest pump cartridge is always fitted at the flange housing end. It is not possible to have identically sized pump cartridges as a double pump.

## Huade Ordering details

	PV	-1X /			15					*	
<b>Pump type</b>											Further details in clear text
Industrial version	= V										Through drive
Mobile version	= Q										No code = W without through drive
<b>Build size</b> See table on page 5 (e.g. single pump = 2 Double pump = 52)											K01 = 82-2,16-4 (SAE-A, 9T)
<b>Component series</b>		= 1X									K02 = 101-2,22-4 (SAE-B, 13T)
Component series 10 to 19 (10 to 19, unchanged installation and connection dimensions)											K07 = 127-2,32-4 (SAE-C, 14T)
<b>Displacement flow</b> See table on page 5 (e.g. 55.2 cm <sup>3</sup> = 055 )											<b>Flange version</b>
<b>Direction of rotation (viewed on the shaft end)</b>											B = 101-2 (SAE-B); (BS1; 2; 21)
Clockwise											C = 127-2 (SAE-C); (BS4; 5 and BS41 to 54)
Anti-clockwise											<b>Seal material</b>
<b>Shaft end</b>											M = NBR seals
Cylindrical drive shaft (standard)											V = FKM seals
Cylindrical drive shaft (strengthened version) only BS2 to BS54											Only for double pumps
Splined drive shaft											<b>Pressure connection location on the cover</b> (viewed on the cover)
<b>Connections</b>											D = Top (45° to the right of the inlet)
SAE suction and pressure connections, UNC fixing screws											R = Right (135° to the right of the inlet)
Position of the pressure connection on the flange (when viewed on the cover)											L = Left (45° to the left of the inlet)
Top (0° from the inlet)											U = Bottom (135° to the left of the inlet)
Right (90° to the right of the inlet)											D = Top (0° from the inlet)
Left (90° to the left of the inlet)											R = Right (90° to the right of the inlet)
Bottom (180° from the inlet)											L = Left (90° to the left of the inlet)
											U = Bottom (180° from the inlet)

### Ordering example

Single pump: Industrial version (also in mobile version)

PVV 2-1X/055RA15DMB

Double pump: Mobile version (also in industrial version)

PVQ 52-1X/154-068RB15DDMC

## Technical data

### Hydraulic

Build sizes 4 and 5 (pump cartridge)	BS 4					BS 5						
Pressure fluid For use with the operating data shown on page 7	HLP mineral oil DIN 51524 part 2											
Only with FKM seals (V <sup>*)</sup>	Perm. p <sub>max</sub>	bar	175	175	175	175	175	175	175	175		
Phosphate ester (HFD-R)	Perm. n <sub>max</sub>	min <sup>-1</sup>	1200									
Pressure fluid temperature range	°C		- 10 to +70. (recommended: +30 to +60) Take into account the permissible viscosity range									
Viscosity range	mm <sup>2</sup> /s		13 to 860 (recommended: 13 to 54)									
Max. permissible degree of pressure fluid contamination Cleanliness class to ISO 4406 (E) / (c)	Class 20/18/15 <sup>1)</sup>											
Alternative pressure fluids	HFB					HFC						
Max. permissible operating pressure	bar		70					140				
Only in conjunction with a return filter with a retention rate of $\beta_{10} \geq 100$ or more. The permissible pressure fluid temperature range is +15 °C to +50 °C. Maximum permissible RPM: 1200 min <sup>-1</sup>												

Please consult us before using our fixed displacement vane pumps with these pressure fluids!

<sup>1)</sup> The cleanliness class stated for the components must be adhered to in hydraulic systems. Effective filtration prevents faults from occurring and at the same time increases the component service life.

On pages 6 and 7 the stated values for the maximum RPM are valid for an absolute pressure of 1 bar at the inlet.

The maximum permissible RPM has to be corrected in accordance with the following diagrams in relation to the absolute pressure present at the inlet.

#### PVV/PVQ

BS1; BS2; BS4; BS21; BS41; BS42

BS5; BS51; BS52; BS54

Drive torque (measured with  $v = 41 \text{ mm}^2/\text{s}$ ;  $\vartheta = 50 \text{ }^\circ\text{C}$ )

Noise pressure level measured in a low noise room to DIN 45635 part 26.

Distance of noise sensor to pump = 1 m.  $v = 41 \text{ mm}^2/\text{s}$ ;  $n = 1500$  and  $\vartheta = 50 \text{ }^\circ\text{C}$

The noise pressure levels for double pumps lie on average 1 to 3 dB(A) above the values for single pumps.

Drive power (measured at  $v = 41 \text{ mm}^2/\text{s}$ ;  $\theta = 50 \text{ }^\circ\text{C}$ )

$n = 1500 \text{ min}^{-1}$

$n = 1800 \text{ min}^{-1}$

Flow, speed dependent (measured at  $v = 41 \text{ mm}^2/\text{s}$ ;  $\vartheta = 50 \text{ }^\circ\text{C}$ ;  $p = 7 \text{ bar}$ )

Flow losses, pressure dependent (measured at  $v = 41 \text{ mm}^2/\text{s}$ ;  $\vartheta = 50 \text{ }^\circ\text{C}$ )

## Pump cartridges for PVV / PVQ

### Features

- Service friendly due to exchangeable pump cartridges
- Within a build size it is possible to change the flow by exchanging the pump cartridges
- The pump can be changed from type PVV to PVQ or PVQ to PVV by changing the cartridges.

Type: CARTRIDGE PVV1-1X
