Variable Displacement Motor - A6V

北京华德液压工业 集团有限责任公司 BEIJING HUADE HYDRAULIC INDUSTRIAL GROUP CO.,LTD.	A6V 变量马达 Variable Displacement Motor A6V		
	用于开式和闭式回路 For open and closed circuits	斜轴式轴向柱塞结构 axial tapered piston,bent axis design	RC91100/12.2004
	规格 Size 28—500	高压范围 Peak pressure 至 up to 35MPa	替代: Replace RC91100/09.2003

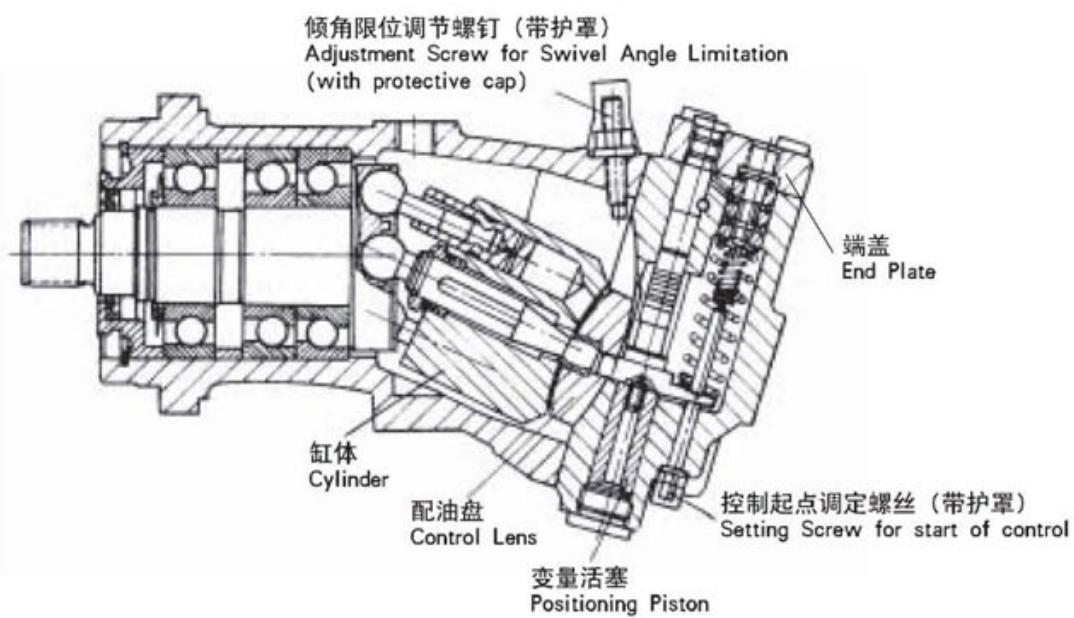

说明:

- 该变量马达是专为带次级控制的静液驱动设计的。
- 配有最大调节范围 $V_{max}/V_{min} = 3.47$ 的整套控制总成。

特点:

- 用静液传动时有较大的调节范围
- 次级控制和带有各种控制装置的调节
- 在较小的倾角下提高最高输出转速
- 由于可用较小的泵而节省费用
- 省掉多速比齿轮驱动
- 高功率密度
- 允许高的外界轴载荷
- 任选安装位置
- 高效率
- 优秀的起动特性
- 小惯量

剖视图:

Description

The variable displacement motor was designed especially for hydrostatic drives with secondary controls. A complete control assembly for a maximum swivel range of $V_{max}/V_{min} = 3.47$ is fitted.

Special Characteristics

Large control range with hydrostatic transmissions.
Secondary control regulation with various control devices.
Increased maximum output speeds at reduced swivel angle.
Cost-saving due to the possibility of using smaller pumps
Obviates the multispeed ratio gear drives.
High power density.
Optional mounting position.
High efficiency.
Excellent starting characteristics.
Low inertia.

HD 液控变量

按外控油源的先导压力来无极的控制马达的排量
标准结构：按第2种装配型式供货

控制起点在 $V_{g\max}$ (最大扭矩、最低转速)

控制终点在 $V_{g\min}$ (最小扭矩、最高转速)

对于第一种装配型式，控制功能相反：

控制起点在 $V_{g\min}$ 控制终点在 $V_{g\max}$

变量机构的设定

有两种方案供选用：

1. HD1—先导压力压差(由 $V_{g\max} \rightarrow V_{g\min}$)— $\Delta P_s = 1 \text{ MPa}$

控制起点可调 _____ 从 0.2–2 MPa

标准设定值：控制起点压力为 0.3 MPa，控制终点压力为 1.3 MPa

2. HD2—先导压力压差(由 $V_{g\max} \rightarrow V_{g\min}$)— $\Delta P_s = 2.5 \text{ MPa}$

控制起点可调 _____ 从 0.5–5 MPa

标准设定值：控制起点压力为 1 MPa，控制终点压力为 3.5 MPa，
当用 HD 作双速控制时，最高先导压力可到 7.5 MPa

外控口 X 处的供油量：约 0.5 L/min.

当工作压力 < 1.5 MPa 时，必须在 G 口供入 1.5 MPa 的辅助压力。

Hydraulic Control,Pilot Pressure Related,HD

Stepless control of the motor capacity dependent on a pilot pressure signal.

Standard model:assembly type 2

Start of control at $V_{g\max}$ (max.torque, min.speed)

End of control at $V_{g\min}$ (min.torque,max.speed)

For assembly type 1, the control function is reversed:

Start of control at $V_{g\min}$,end of control at $V_{g\max}$

Setting of Regulator

Two options are available:

1.HD1

Pilot pressure increase adjustable($V_{g\max} - V_{g\min}$) — $\Delta P_s = 1 \text{ MPa}$

Start of control adjustable—from 0.2–2 MPa

Standard setting: start of control at 0.3 MPa (end of control at 1.3 MPa)

2.HD2

Pilot pressure increase ($V_{g\max} - V_{g\min}$) — $\Delta P_s = 2.5 \text{ MPa}$

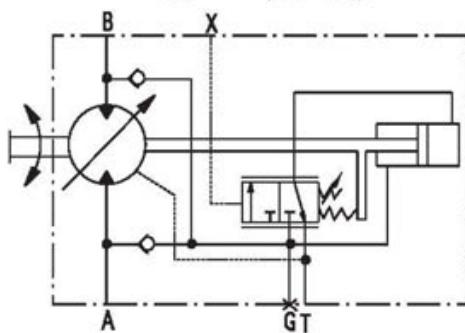

Start of control adjustable—from 0.5–5 MPa

Standard setting: start of control at 1.0 MPa (end of control at 3.5 MPa)
When using the HD control as a two-point control a max.pilot pressure of 7.5 MPa is permissible.

The max oil flow at pilot X is approx 0.5 L/min.

Should the available operating pressure be <1.5 MPa then an auxiliary pressure of 1.5 MPa must be applied at port G.

HD. 液控变量(HD1, HD2)

HD1D 液控恒压变量

恒压控制是在 HD 功能基础上增加的。

如果系统压力由于负载扭矩缘故或由于马达摆角减小而升高，则达到恒压控制的设定值时，马达摆出到较大的摆角。

由于增大排量和减小压力，控制偏差消失。

通过增大排量，马达在恒压下产生较大扭矩。

通过在油口 G2 处施加一压力信号可得到第二个恒压设定压力。
(如起身和下降)，该信号须在 2–5 MPa 之间。

恒压控制阀的设定范围为 8–40 MPa。

标准型：按第二种装配型式供货。

控制起点在 $V_{g\max}$ (最大扭矩、最低转速)

控制终点在 $V_{g\min}$ (最小扭矩、最高转速)

HD1D:Constant pressure control

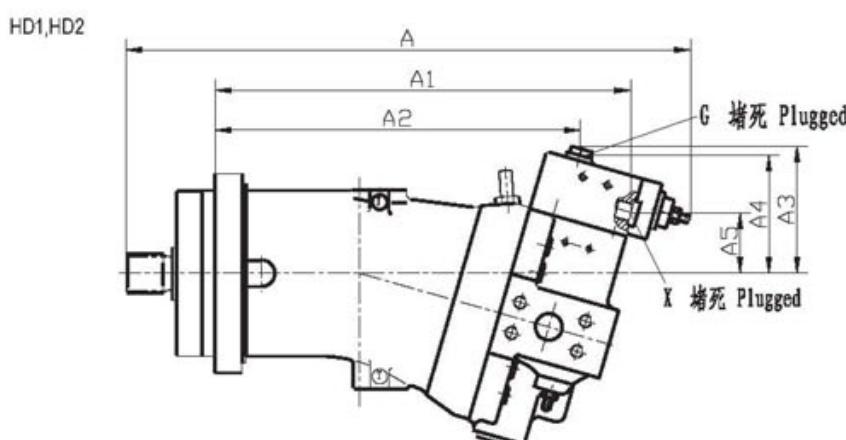

The constant pressure control is superimposed on the HD function.

Should system pressure rise as a result of the load torque or reduction of the motor swivel angle, When the setting swivelled out to a higher angle.

As a result of the increased displacement and consequent pressure reduction, the control deviation is eliminated. By increasing the displacement the motor produces a higher torque at a constant pressure.

Throw a pressure signal at port G2 will receive the second constant setting pressure.
(for example rise and drop), the signal between 2 and 5 MPa.

Setting range of constant pressure control valve: 8–40 MPa

HS 液控双速变量

按外控油源的先导压力来两点式的控制马达排量
标准结构：按第2种装配型式供货。

控制起点在 V_{gmin} (最大扭矩、最低转速)

控制终点在 V_{gmax} (最小扭矩、最高转速)

对于第一种装配型式，控制功能相反：

控制起点在 V_{gmin} 控制终点在 V_{gmax} 。

变量机构的设定

有两种方案供选用

1.HS1 - 控制起点可调 - 从 0.2-2MPa

2.HS2 - 控制起点可调 - 从 0.5-5MPa

(由 $V_{gmin} \rightarrow V_{gmax}$) - $\Delta p \leq 0.2$ MPa

外控口 X 处的供油量：约 0.5L/min.

当工作压力 < 1.5MPa 时，必须在 G 口供入 1.5MPa 的辅助压力。

Hydraulic Control,2-Speed Pilot Pressure Related,HS

Two point Control of the motor capacity dependent on a pilot pressure signal.

Standard model:assembly type 2

Start of control at V_{gmin} (max.torque,min speed)

End of control at V_{gmax} (min.torque,max, speed)

For assembly type 1,the control function is reversed:

start of control at V_{gmax} ,end of control at V_{gmin} .

Setting of Regulator

Two options are available:

1.HS1-Start of control adjustable-from 0.2-2MPa

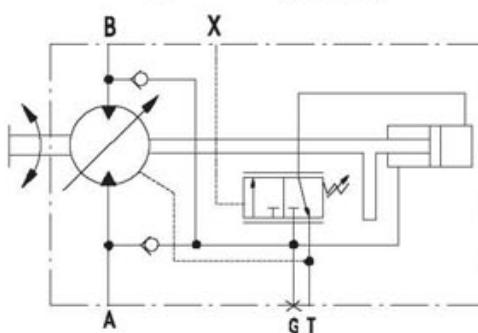

2.HS2-Start of control adjustable-from 0.5-5MPa

($V_{gmax}-V_{gmin}$) - $\Delta P \leq 0.2$ MPa

The max oil flow at pilot X is approx 0.5L/min.

Should the available operating pressure be < 1.5MPa then an auxiliary pressure of 1.5MPa must be applied at port G.

HS 液控双速变量(HS1- HS2)

HA 高压自动变量

按工作压力自动控制马达排量

标准结构：按第1种装配型式供货

控制起点在 V_{gmin} (最小扭矩、最高转速)

控制终点在 V_{gmax} (最大扭矩、最低转速)

此种变量方式，当 A 或 B 口的内部工作压力达到设定值时，
马达由最小排量 V_{gmin} 向最大排量 V_{gmax} 转变。

控制起点在 8 至 35MPa 间可调。

有两种方式供选用：

1.HA1- 在控制范围内，工作压力保持恒定。 $\Delta P=1$ MPa
从 V_{gmin} 变至 V_{gmax} 时，压力升高约为 1MPa。

2.HA2- 在控制范围内，工作压力升高。 $\Delta P=10$ MPa
从 $V_{gmin}(7^\circ)$ 变至 $V_{gmax}(25^\circ)$ 时，压力升高 10MPa。

HA 变量可在 X 口进行外控（即带有超调），在这种情况下，
变量机构的压力设定值（工作压力）按每 0.1MPa 先导
(外控) 压力下降 1.6MPa 的比率降低。

例如：

变量机构起始变量压力设定值为 30MPa。

先导压力(X 口)：0MPa 时变量起点在 30MPa。

先导压力(X 口)：1MPa 时变量起点变为 14MPa。
(30MPa - 10 × 1.6MPa = 14MPa)

Automatic Control,High Pressure Related,HA

Automatic,control of motor capacity dependent on operating pressure.

Assembly type 1 Standard model:assembly type 1

Start of control at V_{gmin} (min.torque,max speed)

End of control at V_{gmax} (max.torque,min speed)

This control device measures the internal operating pressure at port A or B (no pilot line required), and when the set operating pressure is reached, swivels the motor from min.capacity(V_{gmin}) to max.capacity(V_{gmax}).

Start of control is adjustable between 8MPa and 35MPa.

Two options are available:

1.HA1-Within the control range, the operating pressure is held practically constant. $\Delta P=1$ MPa Pressure increase between V_{gmin} and V_{gmax} is approx 1MPa.

2.HA2-Within the control range, with pressure increase
 $\Delta P=10$ MPa from $V_{gmin}(7^\circ)$ to $V_{gmax}(25^\circ)$.

The HA control can be overridden at port X. In this case, the set value of pressure at the regulator(operating pressure)is reduced 1.6MPa per 0.1MPa pilot pressure.

Example:

Regulator setting:30MPa.

Pilot pressure(at X):0MPa start of control at 30MPa

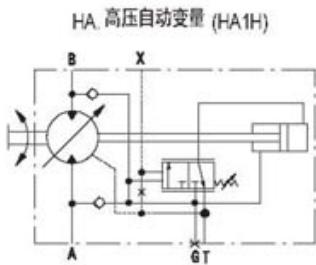

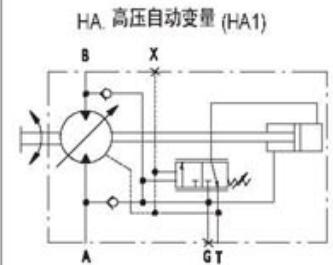

Pilot pressure(at X):1MPa start of control at 14MPa

(30MPa - 10 × 1.6MPa = 14MPa)

A6V 变量马达 Variable Displacement Motor A6V

带有超调的 HA,变量有两种方式供选用:

- 1.HA1H- 在控制范围内, 工作压力保持恒定, $\Delta P=1\text{MPa}$ 。
 - 2.HA2H- 在控制范围内, 工作压力升高, $\Delta P=10\text{MPa}$ 。
- 如果控制仅需达到最大排量, 则允许先导压力最高为 5MPa。
外控口 X 处的供油量 0.5L/min。

Two options are available for HA control with override.

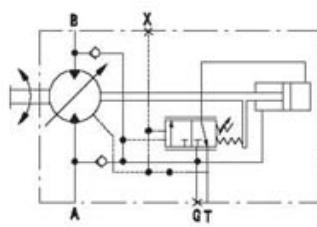

1.HA1H-With in the control range, the operating pressure is held, practically constant, $\Delta P=1\text{MPa}$.

2.HA2H-With in the control range, the operating pressure increases, $\Delta P=10\text{MPa}$.

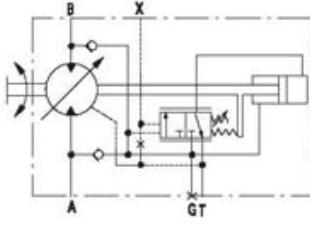

If override is only required to set max.capacity(swivelling the motor to V_{grax}), a pilot pressure of up to 5MPa max is permissible.

The max oil flow at X is approx 0.5L/min.

HA 高压自动变量 (HA2)

HA 高压自动变量 (HA2H)

ES,电控双速变量

马达排量处于 V_{grax} 或 V_{grmin} 是由控制电磁铁通断来实现。

标准结构: 按第 2 种装配型式供货

控制起点在 V_{grax} (最大扭矩、最低转速)

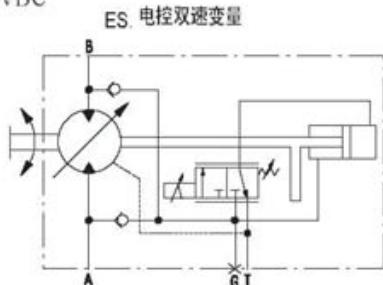

控制终点在 V_{grmin} (最小扭矩、最高转速)

对于第一种装配型式, 控制功能相反:

有两种方案供选用 :

1.ES1- 控制电压 12VDC

2.ES2- 控制电压 24VDC

ES,Electrical 2-Speed Control

The motor capacity is set to V_{grax} or V_{grmin} by switching on or off an electrical current at the switching solenoid.

Standard model;assembly type 2

Start of control at V_{grax} (max.torque min speed)

End of control at V_{grmin} (min.torque max speed)

For assembly type 1 the control function is reversed.

Two options are available;

1.ES1-control voltage 12VDC

2.ES2-control voltage 24VDC

EP,电控比例变量

根据电信号无级的或双点的控制马达排量

标准结构: 按第 2 种装配型式供货

控制起点在 V_{grax} (最大扭矩、最低转速)

控制终点在 V_{grmin} (最小扭矩、最高转速)

对于第一种装配型式, 控制功能相反:

能过比例电磁铁操纵液压控制。

有两种方案供选用 :

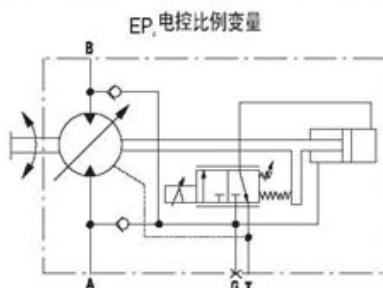

1.ES1- 控制电压 12VDC 400mA-900mA

2.ES2- 控制电压 24VDC 200mA-450mA

如果仅要求变量马达作双点(双速)控制, 则只要使

电流通断即可得到这两个位置(对第 2 种装配型式在 V_{grax} 断电, 对第 1 种装配型式在 V_{grmin} 断电)。

如果工作压力低于 1.5MPa, 则在 G 口要求引入 1.5MPa 的辅助压力。

EP Electrical Proportional Control

For two-speed control of the motor capacity, or for two point control dependent on an electrical signal.

Standard model;assembly type 2

Start of control at V_{grax} (max.torque,min.speed)

End of control at V_{grmin} (min.torque,max.speed)

For assembly type 1, the control function is reversed.

The hydraulic control is operated by a proportional solenoid.

Two options are available:

1.EP1-control voltage 12VDC

2.EP2-control voltage 24VDC

Should the variable motor only be required for two point control, simply switching the current on and off is sufficient to attain these two positions (for assembly type 2: deenergise at V_{grax} , for assembly type 1: deenergise at V_{grmin}). if the operating pressure is less than 1.5MPa, then an auxiliary pressure of 1.5MPa is required at port G.

A6V 变量马达 Variable Displacement Motor A6V

DA. 转速液控变量

转速液控变量只用于与变量泵 A4V.DA 合用的传动系统。

装配型：2

变量起点，按先导压力：在 V_{gmin} (到 V_{gmax})

按工作压力：在 V_{gmin} (到 V_{gmax})

起点在 V_{gmax} (最大扭矩)。

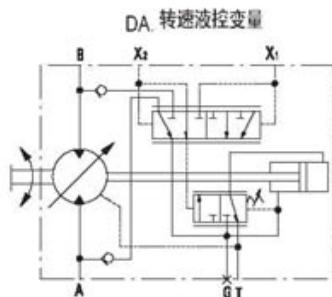

由 A4V 变量泵确定的先导压力(提高原动机转速 = 提高变量泵转速 = 提高先导压力)引到 X1 或 X2 口，视行驶方向而定，使马达向减小排量方向转变(扭矩减小，转速增加)。

若工作压力升高到超过变量机构设定的压力值，则马达向增大排量方向转变(扭矩增大，转速降低)。

先导压力与高压保持定值： $Pst/PH=3/100$ 。

先导压力变化 0.3MPa(升或降)相应使工作压力升、降 10MPa。

设计带 DA 变量的驱动时，必须考虑 A4V.DA 变量泵的技术数据。

MO. 扭矩变量

扭矩变量，主要用来驱动绞车，产生恒定的牵引力。

装配型式：第 1 种装配型式

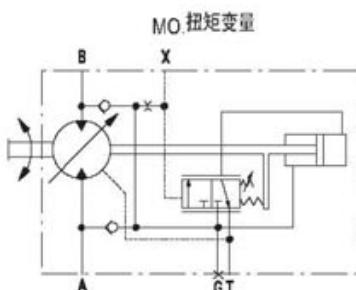

控制起点在 V_{gmin} (最小扭矩、最高转速)

变量机构的设定：

先导压力升高($V_{gmin} - V_{gmax}$) $\Delta p=5$ MPa，控制起点从 8~35MPa，可调(订货时注明)。

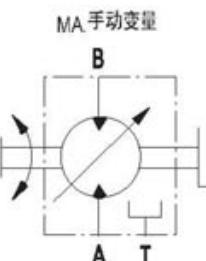

通过改变马达的排量可以得到恒定的扭矩，它可根据需要进行改变，使绞车产生恒定的牵引力。如果卷筒上没有拉力，则马达在较低的压力下工作，从而先导压力也较低，马达排量减小，转速增加，绞车加速运转，直至达到绞车的拉力时保持拉力并停止运转。为限制马达的最高转速，在回中马达前面应设有流量阀或类似元件。

作为扭矩变量本身的先导控制，可采用一个溢流阀调节。X 口最大供油量约为 5L/min，随先导压力与工作压力差的降低，先导油液流量也减小。

MA. 手动变量

通过手轮驱动螺杆以调节马达的排量。装配型式：第 1 种装配型式

DA Hydraulic Control, Speed Related.

Speed related hydraulic control is used exclusively for transmission drives in conjunction with variable pump A4V.DA.

Assembly design 2

Start of control, pilot pressure dependent at V_{gmin} (to V_{gmax}), high pressure dependent at V_{gmin} (to V_{gmax}).

Start point at V_{gmax} (max.torque).

The pilot pressure, which is determined by the variable pump A4V (increasing speed of prime mover=increasing speed of variable pump=increasing pilot pressure) is directed to ports X1 or X2 dependent on the direction of travel, and causes a swivelling towards smaller motor capacity(lower torque ,higher speed).

Should the operating pressure rise above the set pressure value at the regulator, the variable motor swivels to a higher capacity(higher torque,lower speed).

Pilot pressure and high pressure remain in a fixed relationship $Pst/PH=3/100$.

0.3MPa variation pilot pressure(rise or fall)gives a pressure rise or fall of 10MPa in operating pressure.

When designing a drive with a DA control the technical data of the variable pump type A4V.DA must be considered.

MO, Mooring Control

The mooring control is used mainly for the drive of winches,to generate a constant line pull.

Assembly type 1

Start of control at V_{gmin} (min.torque,max.speed)

Setting of Regulator

Pilot pressure increase($V_{gmin} - V_{gmax}$) $\Delta p=5$ MPa.

Start of control adjustable from 8 to 35MPa (must be indicated in cleat text when ordering).

A constant torque, which may be altered according to requirements in order to generate a constant line pull at the winch is achieved by varying the capacity of the variable motor. If there is no pull at the drum, the variable motor requires a lower operating pressure and therefore generates a smaller pilot pressure. The variable motor moves to a min.capacity(V_{gmin}).The higher motor speed thus resulting (warping speed)causes rapid operation of the winch until the mooring pull required of the winch is reached and set.

In order to limit the maximum speed of the variable motor, a flow limiting valve, or other such suitable, must be placed in the circuit before the motor.

As a pilot control for the mooring control itself, a variable pressure relief valve may be used. The max.oil flow at port X is approx5L/min.The pilot oil flow reduces with lower differential pressure between pilot pressure and operating pressure.

MA, Manual Control

Adjustment of motor capacity dependent on the position of a threaded spindle-hand operation.

Assembly design 1

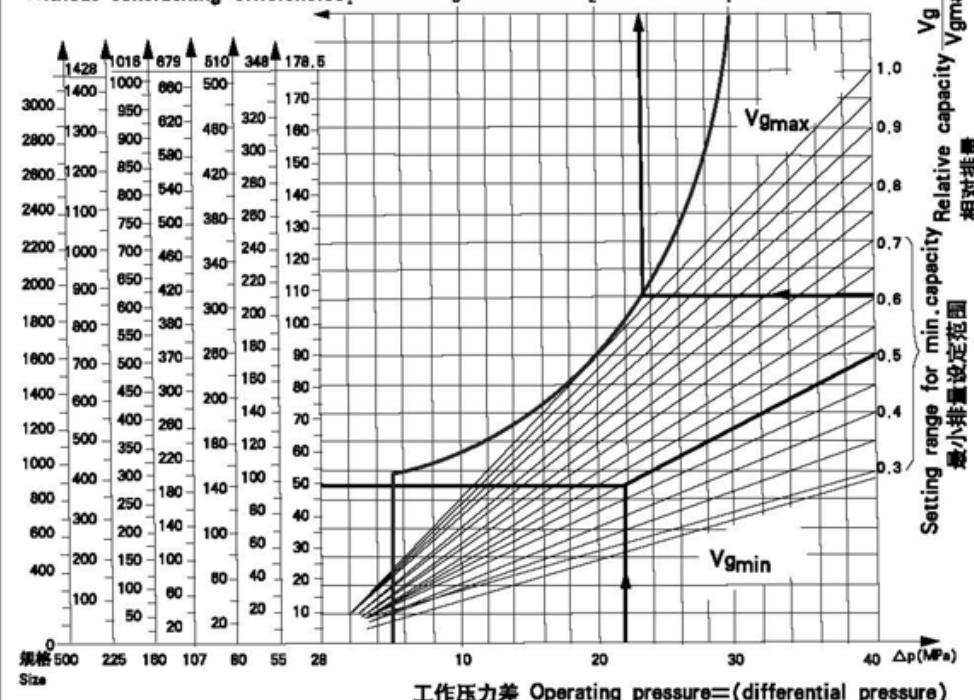

通用特性曲线 General Operating Curve

(P-M) 和 ($\frac{V_g}{n}$ 在 $V_{g\max}$ 时) 特性
Characteristic (P-M) and ($\frac{V_g}{n}$ at $V_{g\max}$)

扭矩 M(Nm) 未计效率!

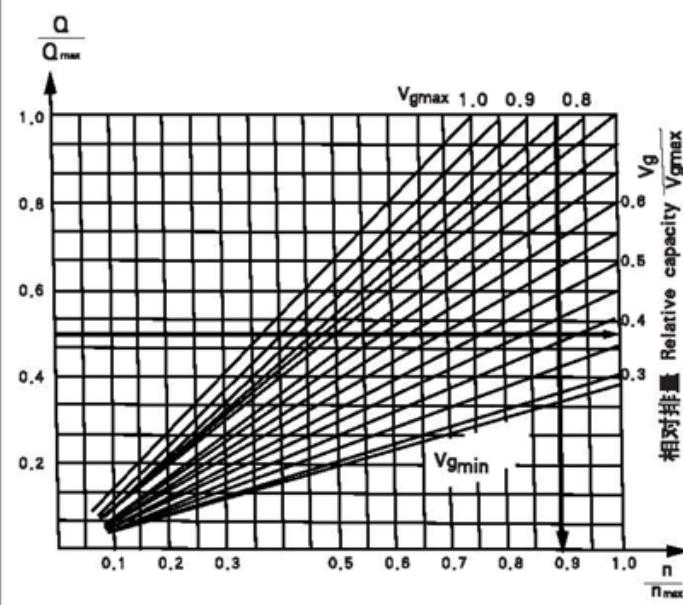

Torque M(Nm)

Without considering efficiencies!

转速与排量的极限值

Limiting values for speed and capacity

应用示例 1

规格 55: 压差 $\Delta P=22 \text{ MPa}$ 排量 $V_g=27.4 \text{ ml/r}$

求: 输出扭矩 M

解: 相对排量

$$\frac{V_g}{V_{g\max}} = \frac{27.4}{54.8} = 0.5$$

在图表即可按 $V_g=0.5V_{g\max}$, $\Delta P=22 \text{ MPa}$ 查出 M=96Nm.

Example 1

Size 55

Differential pressure $\Delta P=22 \text{ MPa}$ Capacity $V_g=27.4 \text{ ml/r}$

Required: Output torque M

Solution: Capacity $V_g=27.4 \text{ ml/r}$

$$\frac{V_g}{V_{g\max}} = \frac{27.4}{54.8} = 0.5$$

0.5 $V_{g\max}$ at 22 MPa gives an output torque M of 96Nm.

应用示例 2

规格 55 排量 $V_g=32.9 \text{ ml/r}$

求: 相对转速

$$\text{由 } \frac{V_g}{V_{g\max}} = \frac{32.9}{54.8} = 0.6$$

据此由图表中查出相对转速:

$$\frac{n}{n_{\max}} = 1.666$$

即可同样流量下, 马达转速是最大排量($V_{g\max}$)时的 1.666 倍。

Example 2

Size 55

Capacity $V_g=32.9 \text{ ml/r}$

Required: Speed ratio

Solution: Capacity $V_g=32.9 \text{ ml/r}$

$$\frac{V_g}{V_{g\max}} = \frac{32.9}{54.8} = 0.6$$

0.6 $V_{g\max}$ gives a speed ratio of

$$\frac{n}{n_{\max}} = 1.666$$

I.e. at the same flow, the variable motor speed of rotation at factor of 1.666 times the speed at max capacity($V_{g\max}$).

应用示例 1

规格 107

流量 $Q=160.5 \text{ L/min}$ 求: 不超过马达允许最高转速的最小排量(当 $V_g < V_{g\max}$)解: 规格 107 的允许最大流量是: $Q_{\max}=321 \text{ L/min}$. 因此

$$\frac{Q}{Q_{\max}} = \frac{160.5}{321} = 0.5$$

由表查出相对排量为:

$$\frac{V_g}{V_{g\max}} = 0.375$$

因此马达最小排量为:

$$0.375 \times V_{g\max} = 0.375 \times 107 = 40.125 \text{ ml/r}$$

应用示例 2

规格 107

马达排量 $V_g=91 \text{ ml/r} < V_{g\max}$

求: 允许最高转速 n

解:

相对排量

$$\frac{V_g}{V_{g\max}} = \frac{91}{107} = 0.85$$

据此在图表中查出对应的相对转速

$$\frac{n}{n_{\max}} = 0.9$$

$$\therefore n = 0.9 n_{\max} = 0.9 \times 4000 = 3600 \text{ r/min}$$

Example 1

Size 107

Oil flow $Q=160.5 \text{ L/min}$

Required: Minimum permissible capacity in order not to exceed the maximum permissible motor speed

(at $V_g < V_{g\max}$)

Solution: Max permissible oil flow for size 107 is 321 L/min, therefore

$$\frac{Q}{Q_{\max}} = \frac{160.5}{321} = 0.5$$

This gives a capacity of :

$$\frac{V_g}{V_{g\max}} = 0.375$$

The minimum motor capacity is therefore

$$0.375 \times V_{g\max} = 0.375 \times 107 = 40.125 \text{ ml/r}$$

Example 2

Size 107

Motor capacity $V_g=91 \text{ ml/r} < V_{g\max}$

Required:

Maximum permissible speed n

Solution: Motor capacity

$$\frac{V_g}{V_{g\max}} = \frac{91}{107} = 0.85$$

The motor capacity $0.85 V_{g\max}$ gives

$$\frac{n}{n_{\max}} = 0.9$$

$$\therefore n = 0.9 n_{\max} = 0.9 \times 4000 = 3600 \text{ r/min}$$

A6V 变量马达 Variable Displacement Motor A6V

HD 特性曲线 Control curve

(P-M)和($V_g - \frac{n}{n \text{ 在 } V_{\max} \text{ 时}}$)特性

Characteristic (P-M) and ($V_g - \frac{n}{n \text{ at } V_{\max}}$)
扭矩 Torque M(Nm)

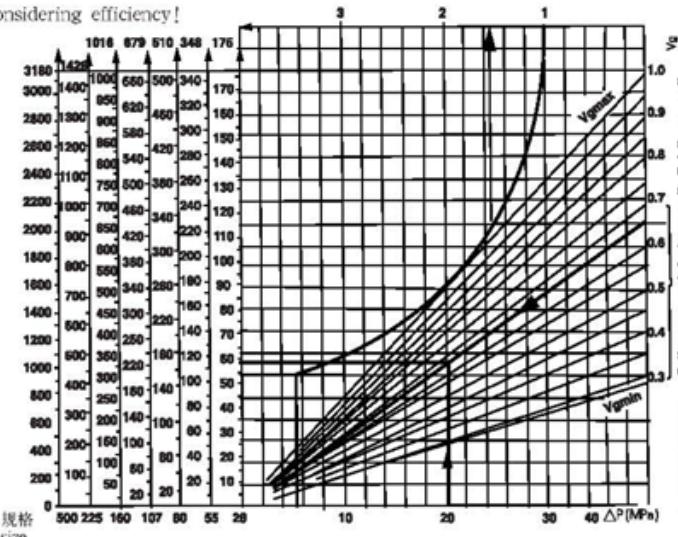

未计效率! Without considering efficiency!

相对转速

Speed ratio $\frac{n}{n \text{ at } V_{\max}}$

控制起点在 0.5 和 5MPa 间可调 (设计 $\Delta P_s=2.5$ MPa)

Beginning of control adjustable between 0.5 and 5 MPa
(design $\Delta P_s=2.5$ MPa)

应用示例:

规格 size: HD1; $\Delta P_s=1$ MPa

当 $P_s=0.8$ MPa 及 $\Delta P=20$ MPa 时

求: 输出扭矩和相对转速

解:

$P_s=0.8$ MPa 对应的 $\frac{V_g}{V_{g\max}} = 0.65$
和 $\frac{n}{n \text{ 在 } V_{\max}} = 1.54$

$V_g = 0.65 \times V_{g\max} = 0.65 \times 54.8 = 35.6 \text{ ml/r}$

在 $\Delta P=20$ MPa 时的扭矩
 $M=114 \text{ Nm}$.

Example
size 55.HD1

Start of control at pilot pressure increase
 $\Delta P_s=1$ MPa

available pilot pressure main pressure
 $P_s=0.8$ MPa and $\Delta P=20$ MPa

Required: Output torque and speed ratio

Solution: At a Pilot pressure of 0.8 MPa
a capacity ratio $\frac{V_g}{V_{g\max}} = 0.65$

and speed ratio $\frac{n}{n \text{ at } V_{\max}} = 1.54$

$V_g = 0.65 \times V_{g\max} = 0.65 \times 54.8 = 35.6 \text{ ml/r}$

At a main pressure (differential pressure)
of $\Delta P=20$ MPa the output torque will be
approximatei approxi 114Nm

EP 特性曲线 Control Curve

相对转速

Speed ratio $\frac{n}{n \text{ at } V_{g\max}}$ 

工作压力 (压差) Operating pressure=(differential pressure)

应用示例 1

规格 55: HA1

变量起点压力设定为 17MPa 从 $V_{g\min}$ 到 $V_{g\max}$ 压力恒定, 输出扭矩 $M=90\text{Nm}$,

求: 马达排量和相对转速。

解:

对于 $M=90\text{Nm}$ 和 $\Delta P=17\text{MPa}$ 由图表查出相对排量为

$$\frac{V_g}{V_{g\max}} = 0.6$$

和相对转速 $\frac{n}{n \text{ 在 } V_{g\max} \text{ 时}} = 1.666$.

即在相同流量下马达的转速是在最大排量时约 1.666 倍。

这时的排量

$$V_g = 0.6 \times V_{g\max} = 0.6 \times 54.89 \\ = 32.9\text{ml/r}$$

应用示例 2

规格 55: HA2

变量起点压力设定为 20MPa 从 $V_{g\min}$ 到 $V_{g\max}$ 压力升高 10MPa, 输出扭矩 $M=122\text{Nm}$,

求: 马达排量工作压力和相对转速。

解: 对 HA 的变量马达按如下步骤求解

先找出起始变量压力 20MPa 时与 $V_{g\max}$ 线的交点和变量终点压力 20MPa 时与 $V_{g\min}$ 线的交点和变量终点压力 20+10=30MPa 与 $V_{g\max}$ 线的交点, 该两点的连线即为该马达的变量特性曲线。当 $M=122\text{Nm}$ 时对应于该点的工作压力 $\Delta P=23.5\text{MPa}$, 相对排量为:

$$\frac{V_g}{V_{g\max}} = 0.6$$

相对转速为 $\frac{n}{n \text{ 在 } V_{g\max} \text{ 时}} = 1.666$

$$\text{排量 } V_g = 0.6 \times V_{g\max} \\ = 0.6 \times 54.89 \\ = 32.9\text{ml/r}$$

Example 1

Size 55: HA 1

Start control set at 17MPa

Model without pressure increase from $V_{g\min}$ to $V_{g\max}$.Output torque $M=90\text{Nm}$

Required: Motor capacity and speed ratio

Solution: For a required output torque of

90 Nm and an operating pressure

 $\Delta P=17\text{MPa}$ a capacity ratio

$$\frac{V_g}{V_{g\max}} = 0.6 \text{ and a speed ratio}$$

$$\frac{n}{n \text{ at } V_{g\max}} = 1.666, \text{ is obtained i.e.}$$

at the same oil flow, the variable motor rotates at a factor of 1.666 faster than at max capacity $V_{g\max}$.

The capacity ratio

$$V_g = 0.6 \times V_{g\max} = 0.6 \times 54.89 \\ = 32.9\text{ml/r}$$

Example 2

Size 55: HA2

Start of control set at 20MPa Model with pressure increase from $V_{g\min}$ to $V_{g\max}$ 10MPa. Required output torque $M=122\text{Nm}$.

Required: Motor capacity operating pressure and speed ratio.

Solution: For variable motor HA2 with pressure increase, other characteristics apply.

These are obtained as follows.

The intersection point between line $V_{g\min}$ and the pressure line for the end of control (e.g. start of control 20 MPa pressure increase 10MPa=end of control 30 MPa) is taken.

These two points are joined by a straight line. This is the correct characteristic line. For the required output torque of 122 Nm in the example, an operating pressure of approx 23.5 MPa (3.5MPa pressure increase) and a capacity ratio of

$$\frac{V_g}{V_{g\max}} = 0.6$$

is obtained together with a speed ratio

$$\frac{n}{n \text{ at } V_{g\max}} = 1.666.$$

The capacity ratio

$$V_g = 0.6 \times V_{g\max} \\ = 0.6 \times 54.89 \\ = 32.9\text{ml/r}$$
